

Team Legacy

95% of patients are willing to join trials. Yet few ever hear about them.

Trial Match is a multi-agent system that connects every patient to trials they qualify for, and gives every trial team a shortlist of people ready to join.

Trial teams in the UK open faster than ever. Yet spend weeks empty waiting for patients.

Patients

95%

would consider joining a trial

63%

were never told about one

Administrative Time Taken to Open Trials

122

days to recruit first patient, down from 169

4 in 10

trials still had no patient a month after opening

Patients are willing, and trials are open. What's missing is the connection. Today that depends on a busy doctor remembering which trials exist and checking each one's rules by hand.

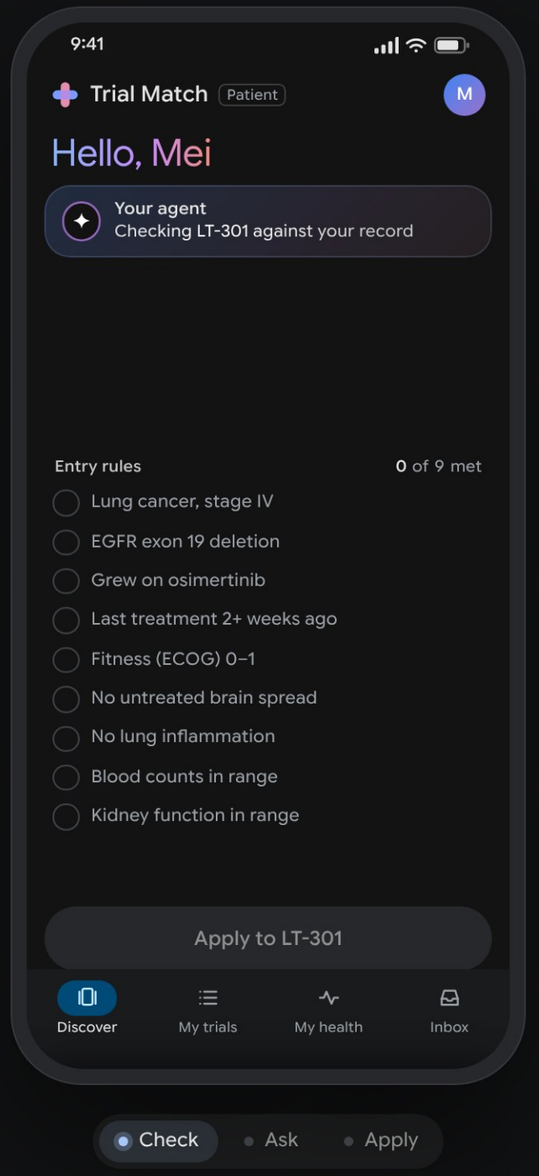

Trial Match makes the connection. On both sides.

For patients

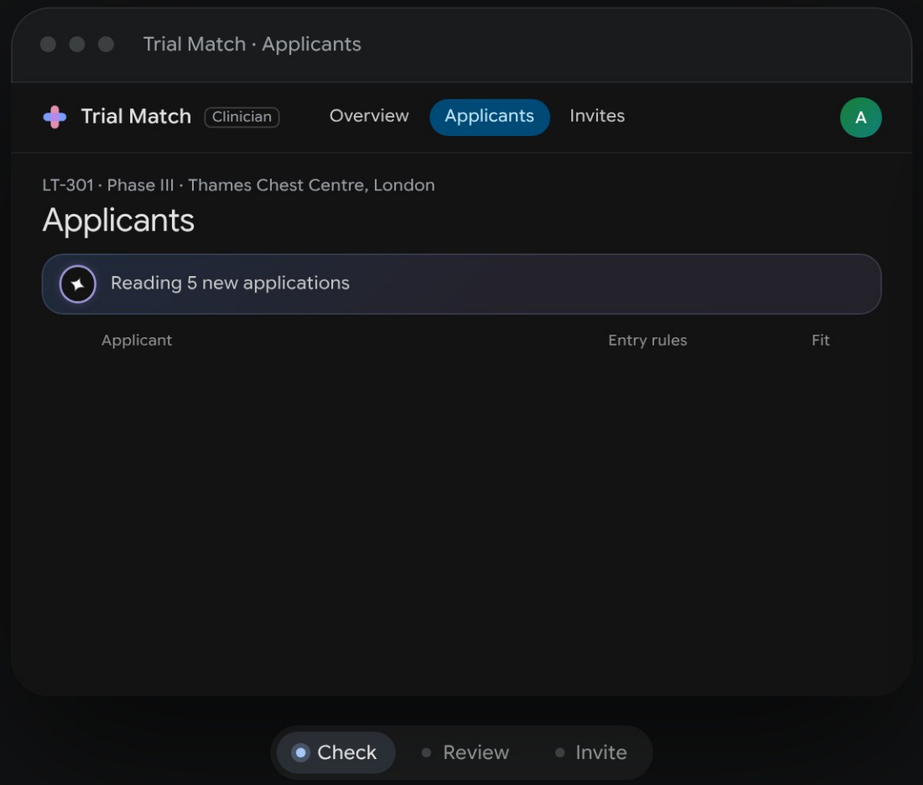

An agent that finds every trial you qualify for.

Connect your record once. Your agent checks every open trial, asks for required information when something is missing, and shows only the trials that fit. Apply when you're ready, or let it apply for you.

Try it as a patient →

Check · Ask · Apply

For trial teams

A ranked shortlist in minutes, not weeks.

Eligibility is checked before patients even arrive. Applicants come ranked by fit, with the record quoted for every rule, and the strongest matches are invited to pre-screening.

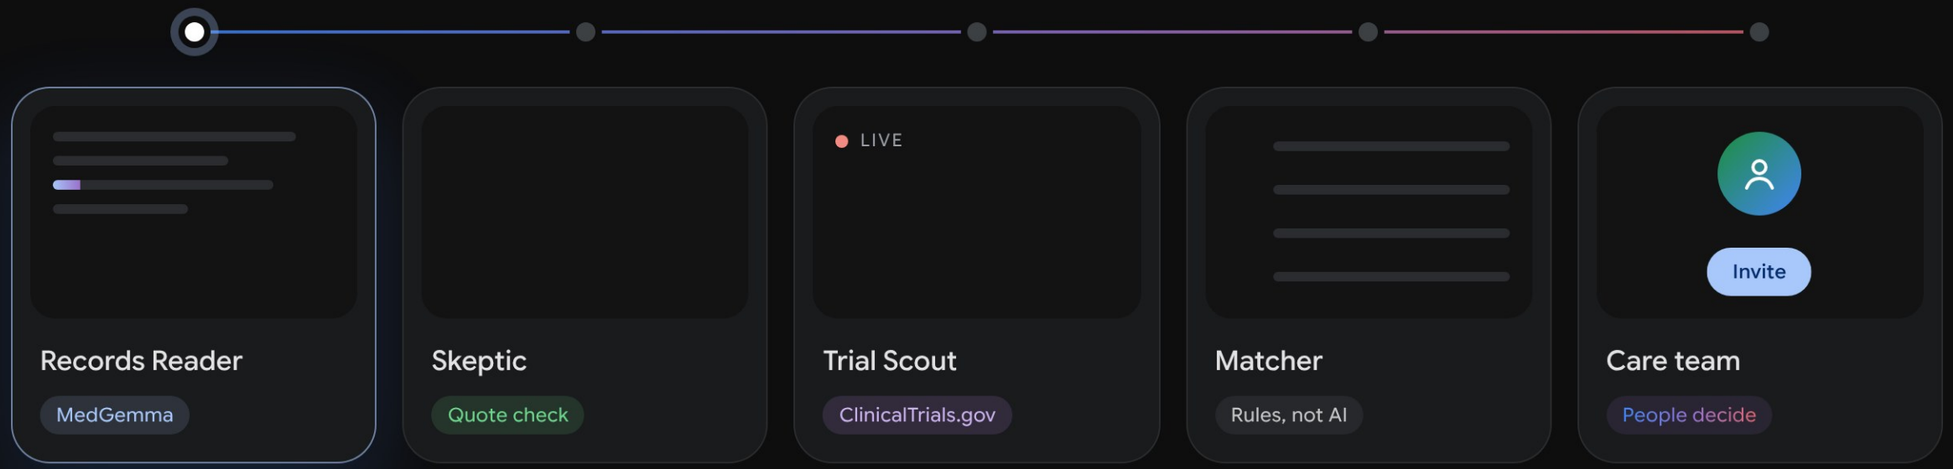

Try it as a clinician →

Every rejection builds a stronger match.

If a patient doesn't qualify after pre-screening, those results go straight back to their agent, which finds the next trial that fits. When someone finishes a trial, their results start the next search.

Under the hood

Each agent does one job.
Every claim is checked against the record.

MedGemma reads. Code checks. Rules match. People decide.

Watch them work

Agents hand work to each other. Your record never crosses the line.

Ask about a drug and a small team gets to work. Gemini researches it online, with public words only. MedGemma reads what it finds against your record, on your own computer. You see every hand-off as it happens.

Gemini researches. MedGemma reads your record, at home. Only public words cross. You see every hand-off.

What the research says

Researcher · Gemini · public sources only

Sotorasib blocks KRAS G12C, a gene change in some lung cancers. [1] In a phase III trial it held the cancer back longer than docetaxel chemotherapy: 5.6 against 4.5 months. [2] Its common side effects include diarrhoea, tiredness and liver changes. [1]

1 FDA label: Lumakras (sotorasib)

Who was studied

What fits

Worth asking

Route → Guard → Research → Hand back → Analyse → Answer

The patient is synthetic. The sources are real: PubMed, FDA labels and ClinicalTrials.gov.

Every rejection costs both patients and researchers weeks in lost time. So we measured that first.

Registry search

93%

of “eligible” matches were wrong

Trial Match

0%

wrong, with every real match still found

11× fewer trials to review: 1.6 trials per patient instead of 16.7.

Offline test, 45,600 synthetic patient–trial pairs.

The agent finds and checks. People decide.

Patients choose what to share

Each record is read only with explicit patient consent.

Patient's name stays hidden

Trial teams see an ID until the patient says yes.

Real humans make the call

Clinicians make the decision for every enrolment.

Patient data remains secure throughout.

Data management is designed with UK GDPR in mind.

Every patient deserves to be asked.
